

PAYMENTS

Turning Payment Complexity into Your Competitive Edge

Scalable Card Management System (Card Management System) and Unified Payment Solutions for a Digital-First Market

From QRIS-driven merchant growth to the demand for instant digital credit, the pressure on legacy infrastructure has never been higher. To win, financial institutions need more than just a system of record; they need a Payment Engine.

LG Sinar Mas provides that engine through CardPerfect™, a modular Card Management System that bridges the gap between traditional card management and the open, high-speed payment world

Future-Proofing Payment Infrastructure through Architectural Excellence

Overcoming the Bottlenecks of Legacy Card Management System

In the Indonesian financial sector, the true cost of legacy infrastructure isn't just maintenance—it's the opportunity cost of inertia. When a Card Management System is built on rigid, hard-coded silos, launching a new credit product or integrating with a new digital wallet becomes a multi-month engineering project.

Architectural Decoupling: Introducing CardPerfect™

At the heart of our solution is CardPerfect™, a proprietary platform from LG CNS designed to solve the complexity of modern card businesses

Model-Based Development Architecture

- **Technical Edge:** Decouples business logic from technical code. Instead of manual programming, new rules are defined via high-level models.
- **Outcome:** Launch products 50% faster by configuring rates and rewards through visual models rather than hard-coding, significantly reducing development errors

Unified Payment Solution for Credit, Debit and Prepaid

- **Technical Edge:** CardPerfect™ utilizes a Single-Core Architecture. It consolidates disparate ledgers and processing engines into one unified business platform.
- **Outcome:** Drastic reduction in IT overhead and a 360-degree view of the customer across all card products, enabling smarter credit risk assessment and cross-selling

Scalable Micro-Architecture and Open APIs

- **Technical Edge:** Built on a cloud-native, scalable framework with finance-specialized Front-End Processor (FEP) solutions.
- **Outcome:** Seamlessly handle traffic spikes and integrate with external ecosystems (e.g., E-commerce, Super Apps, and QRIS) without compromising core system stability

The LG Sinar Mas Partnership: Global Pedigree, Local Execution

We combine the battle-tested legitimacy of LG CNS, which architected the world's first parallel verification solution and powers top-tier Korean banks, with the deep local footprint of Sinar Mas.

35+ years

Leverage 35+ years of global Digital Transformation leadership from South Korea

Local Compliance

Systems built to exceed OJK regulatory and security standards

Proven Transformation

As seen in the large-scale core modernization for Bank Sinarmas, we deliver proven systems that scale

Three ways LG Sinar Mas redefines your card and payment operations

Beyond Processing: Creating a Value-Driven Payment Ecosystem

Traditional Card Management Systems are built for stability, but they often sacrifice agility. By utilizing a Model-Driven Architecture, LG Sinar Mas allows your business teams to lead the product roadmap, not the IT department. When business logic is decoupled from technical code, you eliminate the "legacy tax" that slows down innovation.

This shift from manual coding to visual modeling ensures that your institution can respond to market shifts, whether it's a new regulatory change or a competitor's loyalty offer, within days. This is how we move your Card Management System from a cost center to a revenue engine, combining the reliability of global finance with the speed of a fintech.

The Modernization Journey

Our methodology for zero-downtime migration

The Expertise

LG CNS is the architect behind South Korea's most advanced financial infrastructures, including the world's first parallel verification solution

LG Sinar Mas translates this global power into the Indonesian context. We provide the "on-the-ground" expertise required to navigate OJK regulations, local market nuances, and the specific integration needs of the Indonesian digital ecosystem (such as QRIS and local switching networks)

The Scale

Drawing on LG CNS experience, we manage core systems for top-tier global banks, handling millions of high-concurrency transactions daily with zero-fail reliability

The Flow

Phase 1

Diagnosis & Blueprinting

Deep-dive analysis of legacy silos to map data into the CardPerfect™ model

Phase 2

Parallel Infrastructure

Setting up the new core alongside the legacy system to ensure data parity

Phase 3

Verified Migration

Utilizing our proprietary Parallel Verification to transition accounts with zero business interruption.

Phase 4

Ecosystem Integration

Opening the system via Standardized APIs to connect with the broader digital economy

Architectural Agility for the Modern Indonesian Payment Landscape

Transforming Card Management from a legacy constraint into a high-performance growth engine

Most legacy Card Management Systems in Indonesia function as monolithic, hard-coded silos where business logic, such as interest calculations and fee structures, is deeply embedded within the technical source code. This architectural rigidity creates a heavy engineering dependency, as even minor product adjustments require manual code modification and exhaustive regression testing, leading to long deployment cycles and high operational risks.

Furthermore, these systems struggle to interface with the modern Indonesian digital ecosystem, often requiring complex middleware to connect with QRIS or e-wallets, which increases system latency and creates additional points of failure. LG Sinar Mas addresses these bottlenecks through CardPerfect™, a model-driven platform that decouples business intelligence from the underlying technology stack, allowing institutions to configure products via high-level models rather than manual programming to achieve true architectural agility.
